NOTIFICATION DATE	DELIVERY MODE
05/14/2010	ELECTRONIC

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

kara.coffman@ericsson.com
jennifer.hardin@ericsson.com
melissa.rhea@ericsson.com

	Application No.	Applicant(s)
Office Action Summary	10/596,619	NYSTROM ET AL.
	Examiner	Art Unit	
	ISAAK R. JAMA	2617	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE <u>3</u> MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.
- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
  Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on <u>21 April 2010</u>.

2a)☐ This action is **FINAL**.   2b)☒ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) <u>1-65</u> is/are pending in the application.

    4a) Of the above claim(s) <u>1-32</u> is/are withdrawn from consideration.

5)☒ Claim(s) <u>65</u> is/are allowed.

6)☒ Claim(s) <u>32-50 and 52-64</u> is/are rejected.

7)☒ Claim(s) <u>51</u> is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☐ The drawing(s) filed on _____ is/are: a)☐ accepted or b)☐ objected to by the Examiner.

    Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

    Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

    a)☐ All   b)☐ Some * c)☐ None of:

      1.☐ Certified copies of the priority documents have been received.

      2.☐ Certified copies of the priority documents have been received in Application No. _____.

      3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

    * See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1)☒ Notice of References Cited (PTO-892)

2)☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)

3)☒ Information Disclosure Statement(s) (PTO/SB/08)
    Paper No(s)/Mail Date <u>03/23/2010</u>.

4)☐ Interview Summary (PTO-413)
    Paper No(s)/Mail Date. _____ .

5)☐ Notice of Informal Patent Application

6)☐ Other: _____ .

DETAILED ACTION

Response to Arguments

1.   Applicant's arguments with respect to claims 33-64 have been considered but are

moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

2.   The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all

obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set
> forth in section 102 of this title, if the differences between the subject matter sought to be patented and
> the prior art are such that the subject matter as a whole would have been obvious at the time the
> invention was made to a person having ordinary skill in the art to which said subject matter pertains.
> Patentability shall not be negatived by the manner in which the invention was made.

3.   Claims 33, 50, 52, 55, 57, 60 and 63 are rejected under 35 U.S.C. 103(a) as

being unpatentable over U.S. Patent Number 7,184,703 (Naden et al.) in view of U.S.

Patent Number 7,085,314 (Zhu et al.) and further in view of U.S. Patent Application

Publication 2003/0182617 (Kanoaka et al.).

4.   Regarding claims 33, 50, 52, 55, 57, 60 and 63, Naden teaches a wireless relay

based network, comprising: a first node **[Figure 4, # 2, source]**; at least one relay

station **[Figure 4, #s 12, 14 and 16, Relays 1, 2 and 3]**; and a second node **[Figure 4,

4, destination]**; wherein said first node communicates with said second node via said

at least one relay station **[Column 2, lines 44-46]**, wherein each relay station is

operative to: receive a digital communication from said first node **[Column 2, lines 36-

42]**; and Zhu teaches a method and apparatus for reducing signal degradation in a

received signal **[Title]**, whereby a method of modifying the values of a plurality of digital

filter coefficients for use by a digital filter which is a component of a relay station, the

relay station successively receiving a first signal, modifying the first signal using the digital filter to form a second signal, and transmitting the second signal with amplification **[Column 2, lines 36-42]**. But neither Naden nor Zhu explicitly teach that each reliability value indicates how likely the corresponding symbol is a binary one or a binary zero. Kanoaka teaches a data processing apparatus using iterative coding **[Title]**, whereby decoder that corresponds to the turbo encoder of the writing system performs a posteriori probability decoding (APP). Specifically, a log likelihood ratio $L^n(u^*)$ expressed by an a posteriori probability concerning data bits (a probability of uk being 1, and a probability of uk being 0) and a log likelihood radio $L^n(p^*)$ expressed by an a posteriori probability concerning parity bits (a probability of pk being 1, and a probability of pk being 0) are calculated based on the prior information L(uk) that is the likelihood information about the data bits and the prior information L(pk) that is the likelihood information about the parity bits, respectively **[Pages 4 and 5, paragraph 0077]**. Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to incorporate the decoding method of Kanoaka into the combined system of Naden and Zhu in order to calculate the likelihood of the original data..

5.   Regarding claim 50, Naden further teaches that when one relay station transmits multiple digital communications at different times then said second node combines the transmitted digital communications **[Figure 2, column 11, lines 5-20]**.

6.   Regarding claim 57, Naden further teaches that the relay station is used in a wireless multi-hop network **[Column 2, lines 28-32]**.

7.   Claims 34, 36, 37, 53, 54, 61 and 62 are rejected under 35 U.S.C. 103(a) as being unpatentable over Naden et al., Zhu et al, Kanoaka and further in view of U.S. Patent Number 7,236,591 (Sim).

8.   Regarding claims 34, 54 and 62 Naden, Zhu and Kanoaka teach the limitations of claims 33, 52 and 60 above. But Naden and Zhu fail to teach is the use of a maximum a posteriori (MAP) filter that computes reliability values for code symbols based on a code structure of the received digital communication. Sim teaches a method for performing turbo decoding in mobile communication systems whereby in order that the input code words iteratively pass through two convolutional decoders, the two convolutional decoders should have output values corresponding to soft decision values having a probability rate of "0" or "1," not hard decision values such as "0" or "1." To obtain such soft decision values, a Maximum a Posteriori (MAP) decoding method is used, in which a posteriori probability value of a data bit is calculated and the data bit is decoded to obtain the maximum posteriori probability value **[Column 1, lines 32-40]**. Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to incorporate the method of Sim into the combined system of Naden, Zhu and Kanoaka in order to measure the likelihood that the received bit a soft bit, i.e. a 0 or 1.

9.   Regarding claim 36, Naden, Zhu and Kanoaka teach the limitations of claim 33, above. But Naden and Zhu fail to teach that each relay station performs the computing operation using a soft output channel decoder that computes reliability values for information symbols based on a code structure of the received digital communication.

Sim teaches that in order to obtain soft decision values, a Maximum a Posteriori (MAP) decoding method has been suggested, in which a posteriori probability value of a data bit is calculated and the data bit is decoded **[Column 1, lines 36-38]**. Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to incorporate the method of Sim into the combined system of Naden and Zhu and Kanoaka in order to obtain the maximum posteriori probability value.

10.   Regarding claims 37, 53 and 61, Naden, Zhu and Kanoaka teach the limitations of claim 36, 52 and 60 above. But Naden and Zhu fail to teach a soft output channel decoder employs: a maximum a posteriori (MAP) algorithm; a soft output Viterbi algorithm (SOVA); a Log-MAP algorithm; or, a Max-LOG-MAP algorithm. Sim teaches that the primary decoding and the secondary decoding are iterated for a certain number of times using a Maximum a Posteriori (MAP) algorithm, so as to reduce the receiving error rate **[Column 3, lines 24-27]**. Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to incorporate the method of Sim into the combined system of Naden, Zhu and Kanoaka in order to obtain the logarithm of the ratio of the a posteriori probability of each bit.

11.   Regarding claim 35, Naden further teaches that each MAP filter also filters the received digital communication and redistributes noise to unreliable parts in the transmitted digital communication **[Column 3, lines 21-26; Naden discloses that the relay equipment selects from the plurality of signals they receive from source equipments those which are of the highest quality in terms of (SINR), (CINR) or RSS to relay to destination equipments thereby minimizing noise amplification]**.

12.   Claims 38-43 are rejected under 35 U.S.C. 103(a) as being unpatentable over

Naden et al., Zhu et al. and Kanoaka and further in view of U.S. Patent Number

5,115,224 (Kostusiak et al.).

13.   Regarding claims 38-43, Naden, Zhu and Kanoaka teach the limitations of claim

33, above. But Naden and Zhu fail to teach that the computed reliability values are

embedded in the transmitted digital communication. Kostusiak teaches a personal

security system network whereby each receiving transceiver will transmit a relay signal,

which combines (i.e. embeds) the emergency signal with additional received-signal-

strength indication (RSSI) information **[Column 3, lines 37-39]**. Therefore, it would

have been obvious to a person of ordinary skill in the art at the time the invention was

made to incorporate the method of Kostusiak into the combined system of Naden, Zhu

and Kanoaka in order to ascertain how far the transmitting unit is from the receiving unit.

14.   Claims 44-49, 58 and 59 are rejected under 35 U.S.C. 103(a) as being

unpatentable over Naden, Zhu, Kanoaka and further in view of the Applicant's admitted

prior art.

15.   Regarding claims 44-49, Naden, Zhu and Kanoaka teach the limitations of claim

33, above. But Naden and Zhu fail to teach that first node is: a base station; a mobile

station; or, a relay station; second node is: a base station; a mobile station; or, a relay

station; each relay station is: a base station; a mobile station; or, a stand alone relay

station; that the received digital communication is: an uplink received digital

communication; a downlink received digital communication; a base station peer-to-peer

received digital communication; or, a mobile station peer-to-peer received digital

communication, and that the transmitted digital communication is: an uplink transmitted

digital communication; a downlink transmitted digital communication; a base station

peer-to-peer transmitted digital communication; or, a mobile station peer-to-peer

transmitted digital communication. Applicant's admitted prior art discloses that relay

based networks include one station (node A) that transmits information in coded and

modulated digital communications to another station (node B) via one or more relay

stations (RSs). The relay station can be part of a base station (BS), a mobile station

(MS) or a stand-alone relay station. The nodes A and B can be a BS, a MS and/or a

relay station. And, the digital communications could be either uplink communications

(link from MS to BS), downlink communications (link from BS to MS), MS to MS

communications or BS to BS communications **[Page 1, paragraph 0004]**. and in regard

to claim 49, the Applicant's admitted prior art teaches that when multiple relay stations

each transmit the digital communication then said second node combines the

transmitted digital communications **[Figure 5; #s 506 (a) and (b) and 504, pages 1 &2,

paragraph 0009]**. In addition, and in regard to claim 58, the Applicant's admitted prior

art teaches that the second link generally has a larger bandwidth and uses a different

air interface protocol than the first link **[Page 1, paragraph 0008]**. Therefore, it would

have been obvious to a person of ordinary skill in the art at the time the invention was

made to have the relay based networks include one station that communicates with

another via a relay that may be a mobile, a base station or an stand-alone repeater, and

to have the receiving node combine multiple relay signals. And that the bandwidth

allotted between the relay and the destination node is greater than the bandwidth

between the transmitting node and the relay in order to accommodate any additional information that may be required by the receiving node.

16.   Claims 56 and 64 are rejected under 35 U.S.C. 103(a) as being unpatentable over Naden, Zhu and Kanoaka and further in view of U.S. Patent Number 7,130,601 (Khorram).

17.   Regarding claims 56 and 64, Naden, Zhu and Kanoaka teach the limitations of claims 33, 52 and 60 above. But Naden and Zhu fail to teach that the computed reliability values are implicitly embedded in the coded/modulated digital communication transmitted to the second node. Khorram discloses a method for determining received signal strength in a direct conversion receiver whereby the RSSI value (reliability value) includes the amplitude modulation **[Figures 4-7, Column 6, 63-65]**. Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to incorporate the method of Khorram into the combined system of Naden, Zhu and Kanoaka in order to transmit a more robust signal to the receiving node.

Allowable Subject Matter

18.   Claim 51 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

20.   Claim 65 is allowed.

21.   The prior art made of record and relied upon by the Examiner in the prosecution of this Application fails to teach or even suggest "when one relay station knows a channel response of a link between that relay station and said second node then that

relay station is able to construct a transmitted digital communication which is coherently

combined at said second node with a similar transmitted digital communication received

from another relay station" which is recited in claims 51 and 65.

Conclusion

The prior art made of record and not relied upon is considered pertinent to

applicant's disclosure. U,S, Patent Number 5,307,374 (Baier) teaches a digital receiver

with reduced memory requirement for Viterbi equalization..

A shortened statutory period for reply to this final action is set to expire THREE

MONTHS from the mailing date of this action. In the event a first reply is filed within

TWO MONTHS of the mailing date of this final action and the advisory action is not

mailed until after the end of the THREE-MONTH shortened statutory period, then the

shortened statutory period will expire on the date the advisory action is mailed, and any

extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of

the advisory action. In no event, however, will the statutory period for reply expire later

than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the

examiner should be directed to ISAAK R. JAMA whose telephone number is (571)270-

5887. The examiner can normally be reached on Monday-Thursday; 4-10.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Lester G. Kincaid can be reached on (571) 272-7922. The fax phone

number for the organization where this application or proceeding is assigned is 571-

273-8300.

Information regarding the status of an application may be obtained from the

Patent Application Information Retrieval (PAIR) system. Status information for

published applications may be obtained from either Private PAIR or Public PAIR.

Status information for unpublished applications is available through Private PAIR only.

For more information about the PAIR system, see http://pair-direct.uspto.gov. Should

you have questions on access to the Private PAIR system, contact the Electronic

Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a

USPTO Customer Service Representative or access to the automated information

system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
